Introduction. The term decompiler is most commonly applied to a program which translates executable programs (the output from a compiler) into source code in a (relatively) high level language which, when compiled, will produce an executable whose behavior is the same as the original executable program.

I think Modern Compiler Implementation in ML is the best introductory compiler writing text. There's a Java version and a C version too, either of which might be more accessible given your languages background.

A customization point is a code construct that the user can leverage to specialize how a particular library action is handled. A common way of implementing this in C++ is to define a template with the default behavior, and let users specialize it for their own types "e.g., std::hash".
